

Heterogeneous Industries

Revitalising the traditional industrial network to
integrate more creative collaborations

Project type: A master thesis project

Contribution: Design, Coding, Rendering

Site: Istanbul, Turkiye

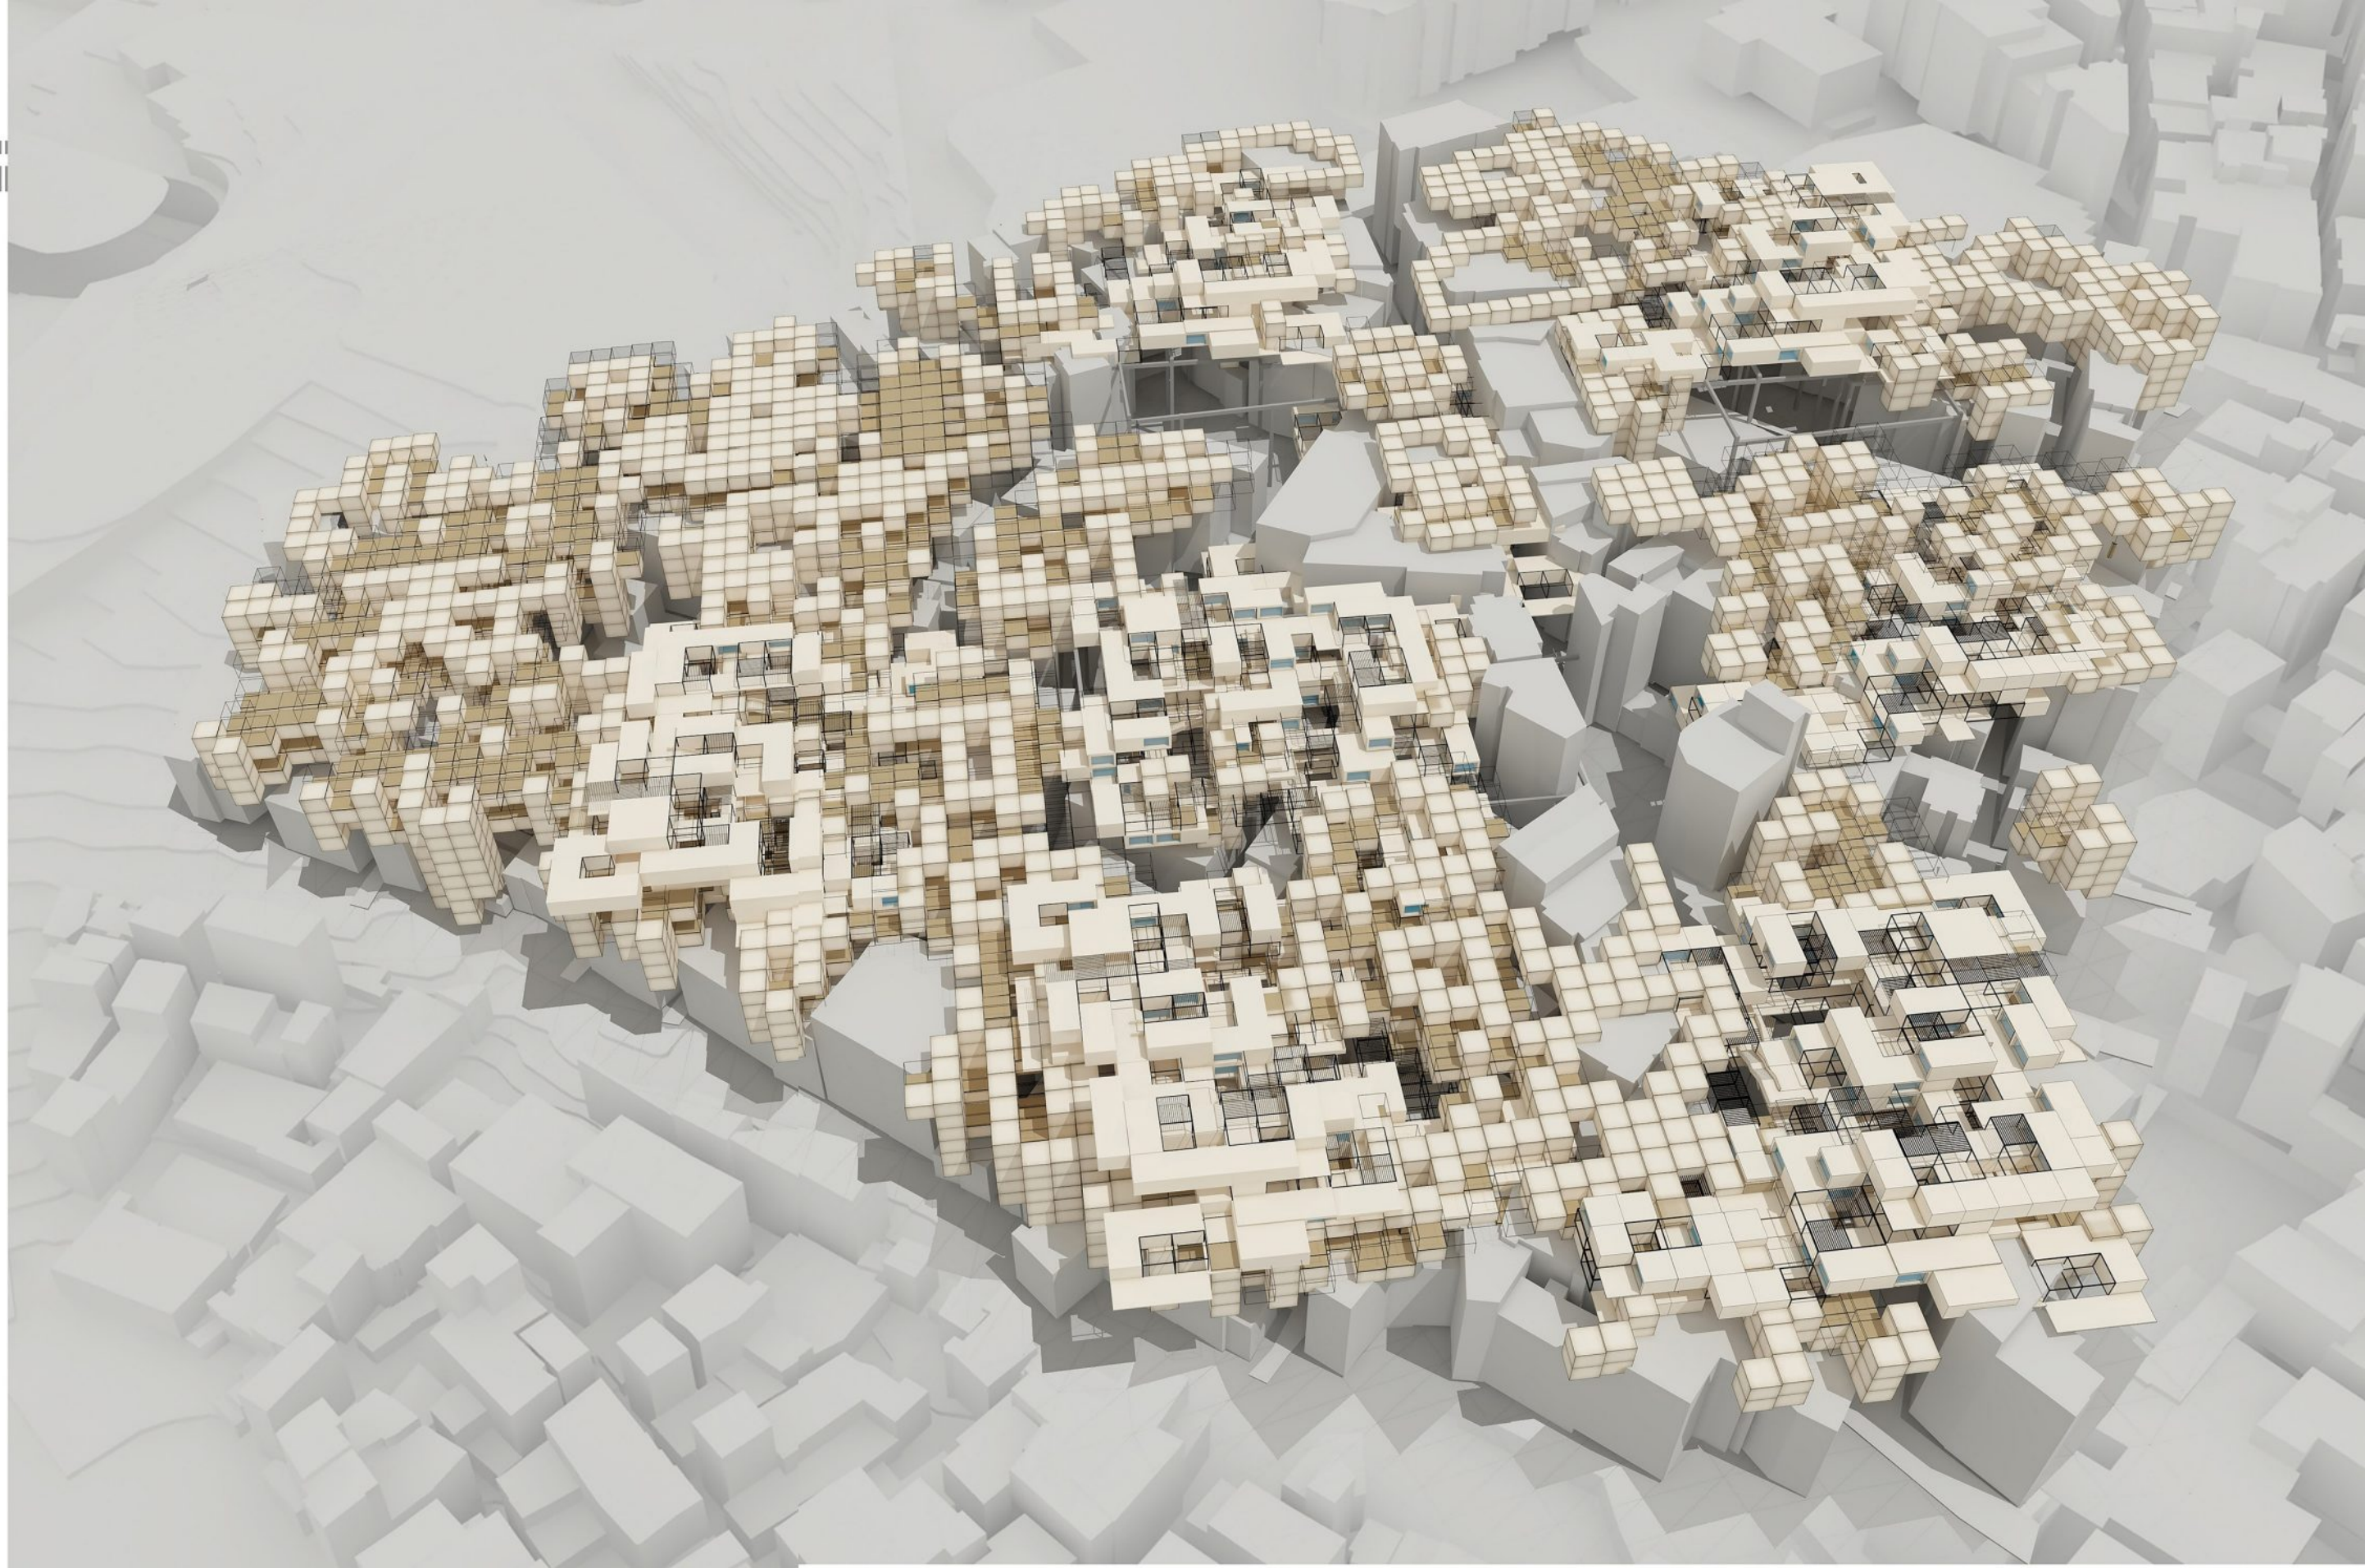

Tools: Processing, Grasshopper, Illustrator, 3DsMax, Vray

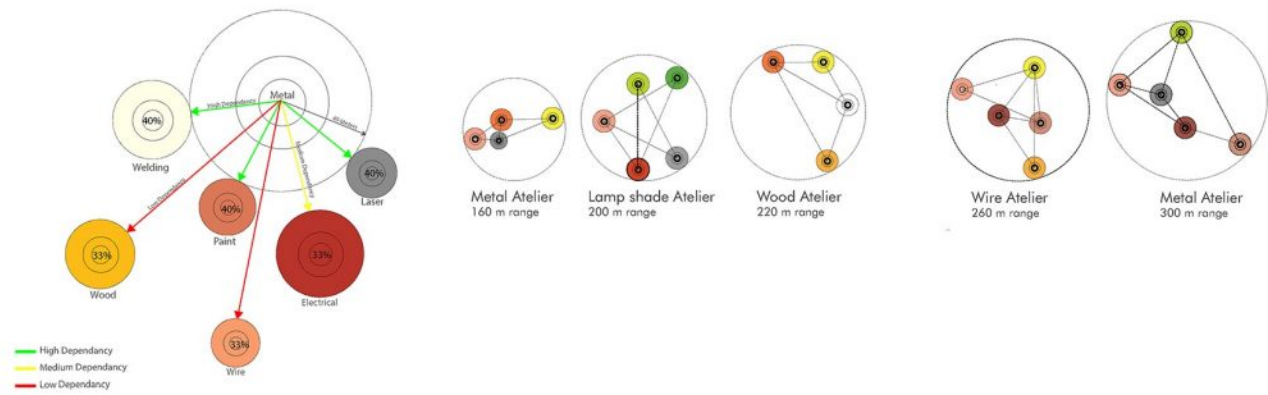

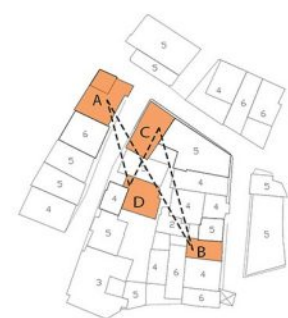

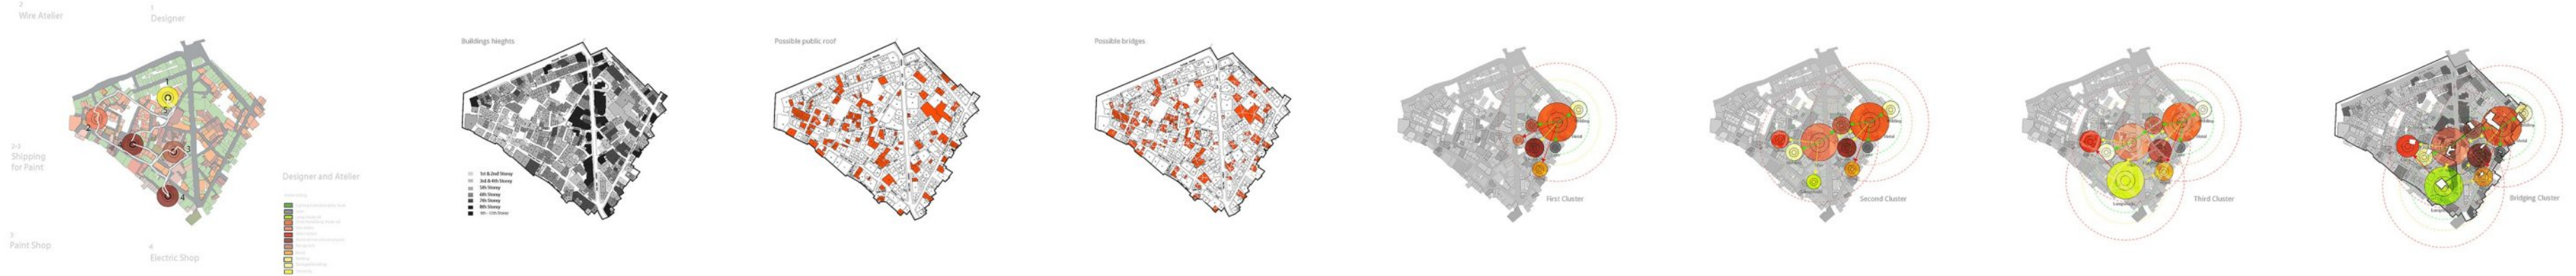

Time:2013

Sishane street, is one of the oldest productions communities in the city center that still exhibits a unique socioeconomic robustness, that is based on decentralized local interaction between productions ateliers using different materials and work together to produce chandeliers from more than a century int the heart of Galata Istanbul.

We were testing the similarities between the network of relations and the informal production line against todays Agent based model over a heavily coded three dimensional Cellular automata to better decode and understand the embedded behaviors that kept this area almost the same for many generations.

After we encoded the semi-lattice network of production, it was coded using processing, then we noted that the roof can enhance the social activities so it was used to trigger a future accommodate more housing for designers and artists to not gentrify but expose the production network to the passing visitors of the old city.

Remapping Ateliers
