

Heterogeneous Assemblages of Atelier Industries

revitalization of socio-economic stratification,
Abdulmalik Abdulmawla
Ali Farhan

The debate of the project starts from understanding an important district of Istanbul, which have significant importance from Byzantine time and used to be a metal industry and later turned as Sishane light manufacturing industry in Ottoman Empire time. In Byzantine and Ottoman empire time sishane district inhabitants used to share common interests and feed each other with their socio-economic, socio-cultural and socio political values. Project is about exploration and analyzing the existing urban situation in terms of social economic activities of existing network of production and their associated group of craft people in production line process and proposing perfect scenarios of communication, interaction environment as lattice. Stage A is the theoretical research stage, which have been defined through the current situation of Galat as crafts district. In stage B all of these properties of program and their essence have been mapped first as two dimensional diagrammatic Lattice then as rule based logic re define the organization of production line dependency network as a cluster and increase the amount of ateliers in each cluster.
